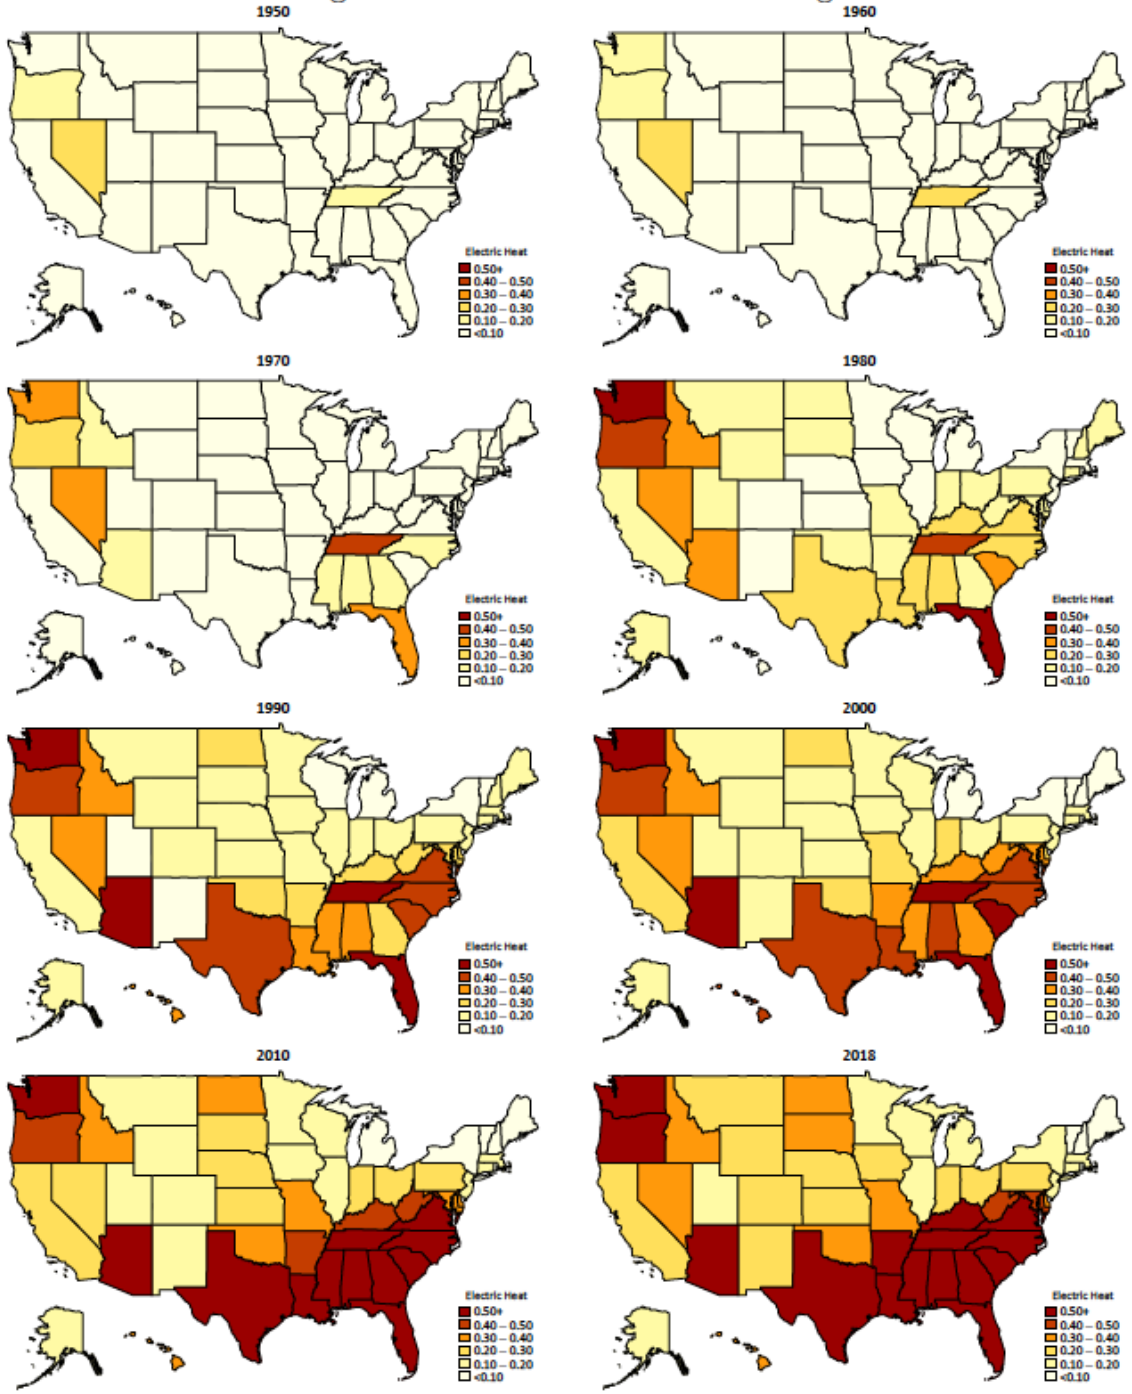
Products

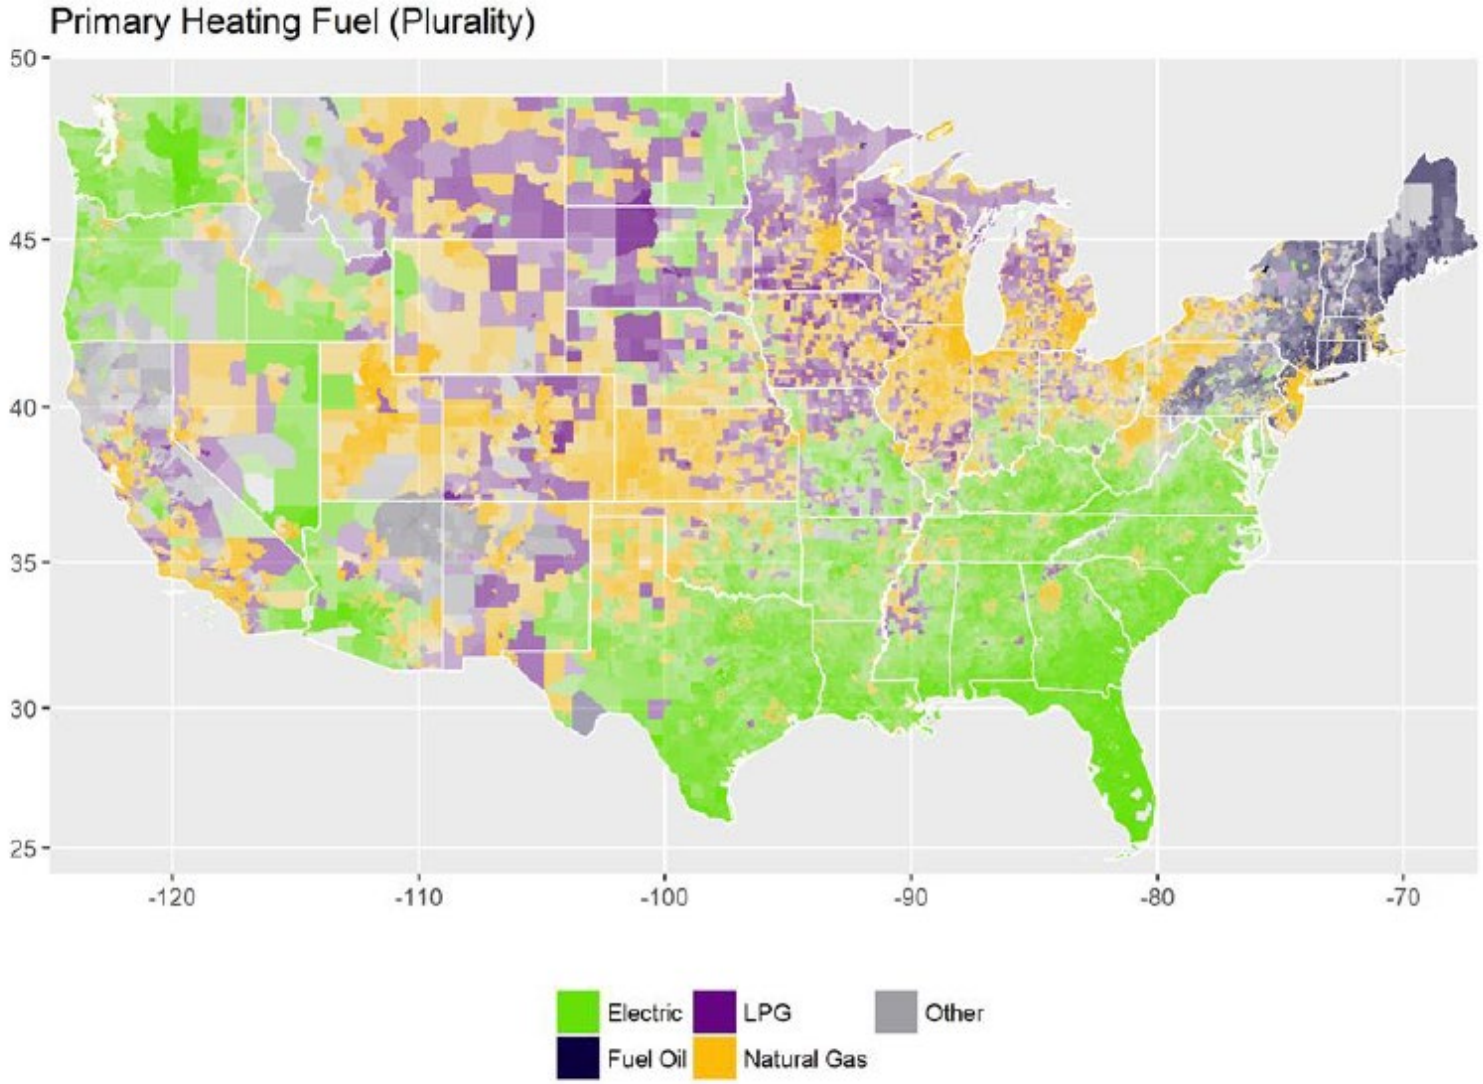


Growth in Electric Heating

- Electrification of largest end-use has been increasing for years.
- We are just going to accelerate this trend.
- Most new-home growth in areas where homes are electrified for heating/cooling.

Figure from Davis, L. 2020. What Matters for Electrification? Evidence from 70 years of US Home Heating Choices. Energy Institute at Haas, WP 309.

Heating Fuel



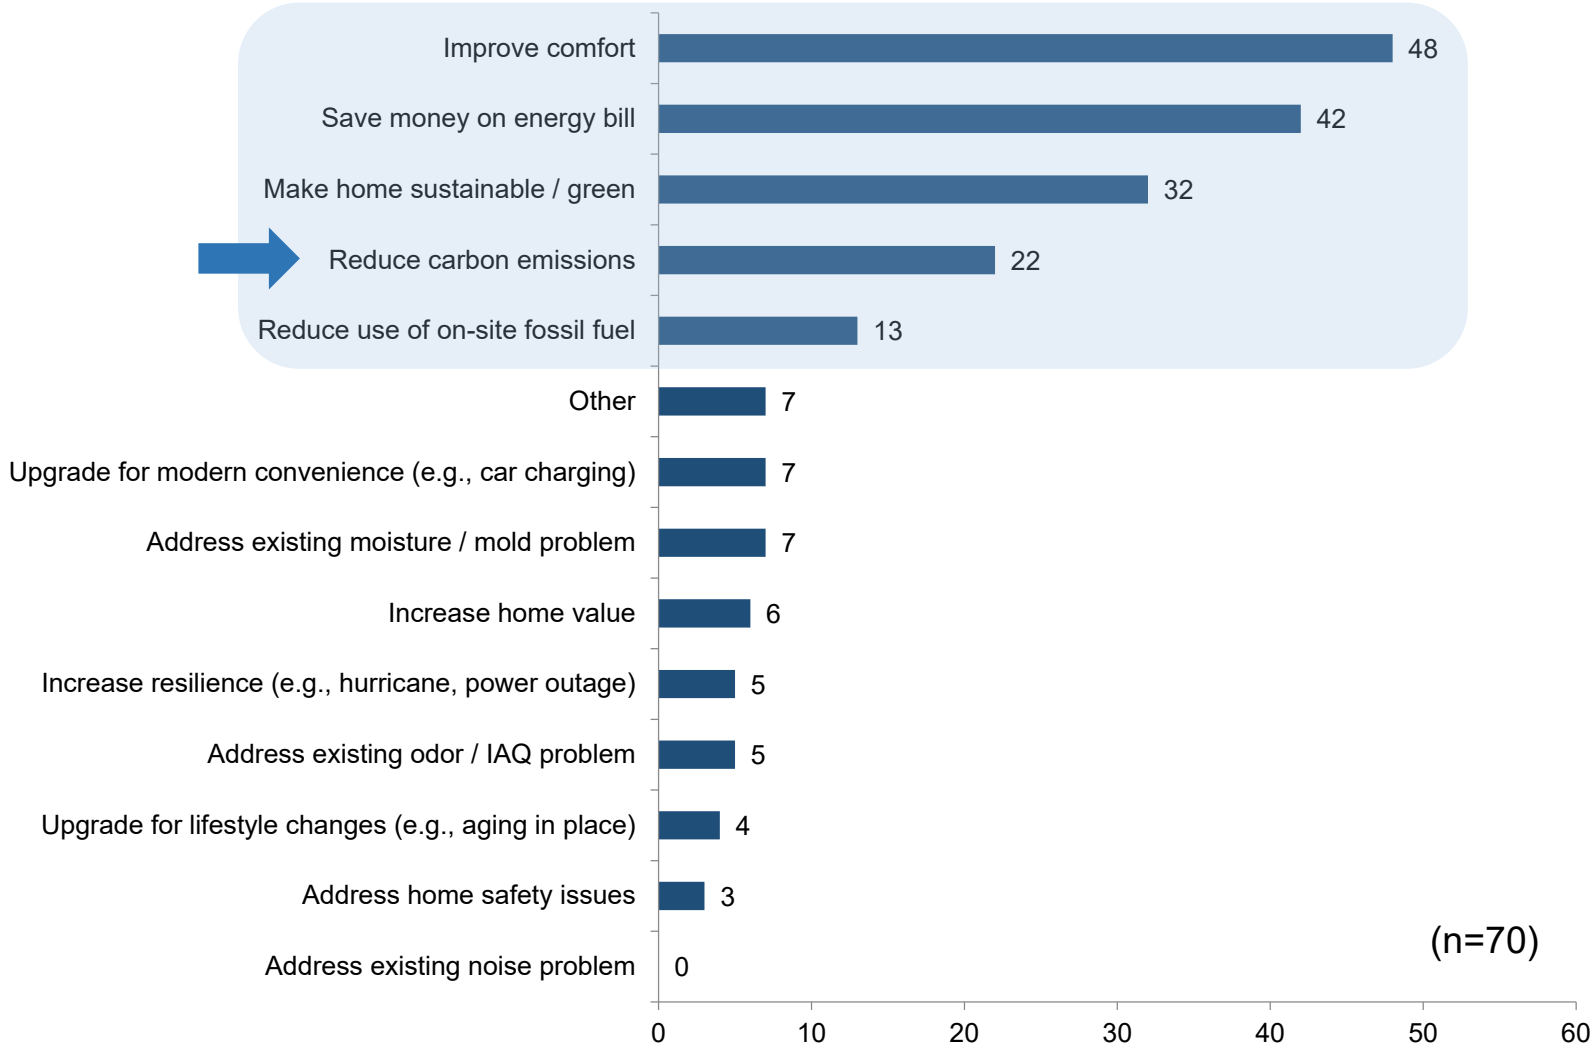
Data from the American Community Survey (2016).

Distribution of Electric Heating

- >25% of homes are already all-electric.
- 40% of homes have electric primary heating.

Customer Motivations

What are the main motivations of homeowners / building owners when seeking to perform a energy upgrade project?



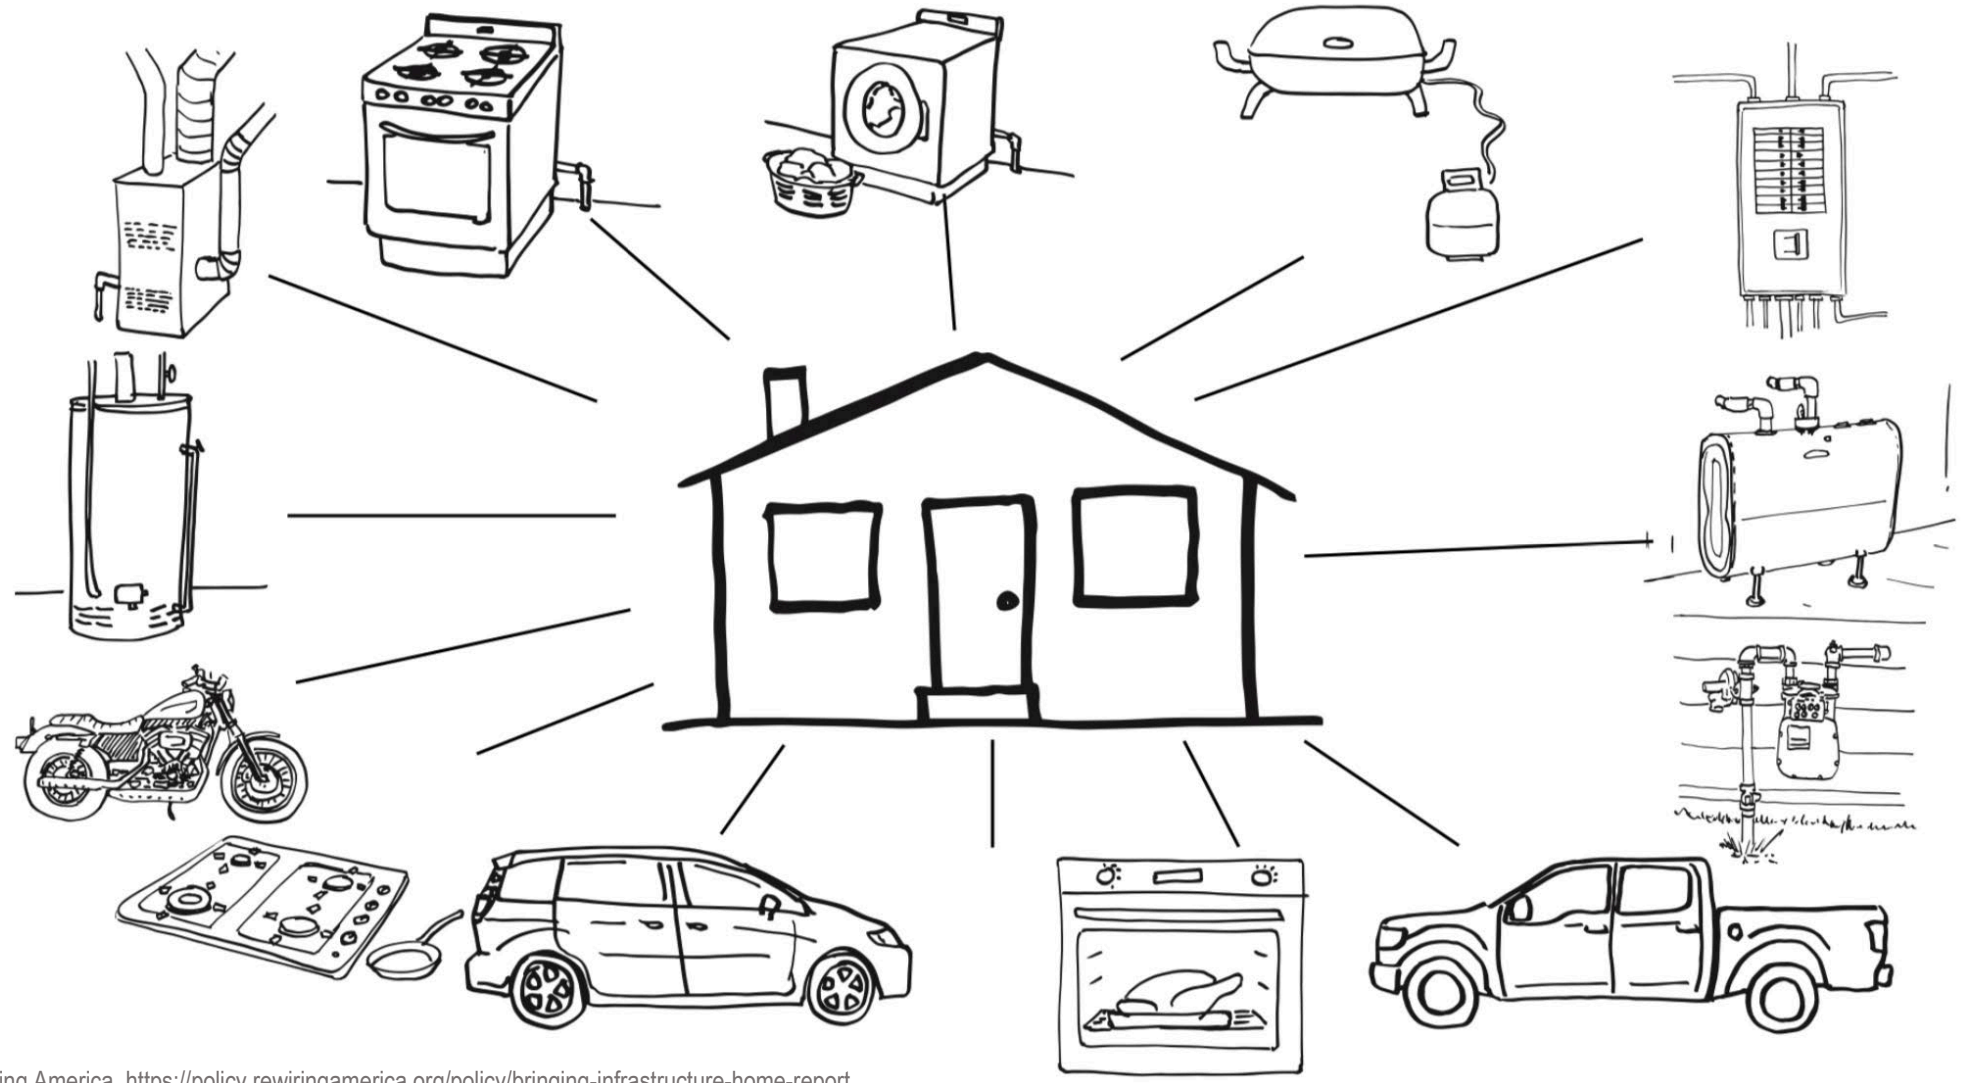
Advanced Technologies and Approaches

What contractors say will increase deep energy retrofits of homes

Ratings =	1	2	3	4	5	Total Responses
"One-stop shop" with energy audit, work scope, financing, permits, construction, testing	2	2	10	21	28	63
Energy plus healthy home retrofit	1	5	23	22	13	64
Standard weatherization combined with heat pump and PV	4	13	18	19	12	66
Over-time DER aligned with equipment replacement / upgrade	6	7	20	16	15	64
Home electrification retrofit	10	8	18	18	10	64
Exterior retrofit with minimal disturbance inside home	9	20	14	14	5	62
Pre-fabricated panelized envelope retrofits (e.g., EnergieSprong)	16	23	11	9	4	63

Why Electrification…?

What is Home Electrification…? Replacing fossil fuels with electricity



Credit: Rewiring America, https://policy.rewiringamerica.org/policy/bringing-infrastructure-home-report

Why Electrification…?

Need to STOP emitting CO_2

Need Low/Zero CO_2 energy – **ELECTRICITY** the only viable option.

- Allows use of Low/Zero carbon renewable energy

"We can't efficiency our way to zero carbon emissions"

- Very limited efficiency gains remain for fossil-fuel heating and DHW

Gas leaks typically about 2-3% but higher GWP makes this a 20-30% increase in greenhouse gas emissions

- 0.5% leakage inside homes

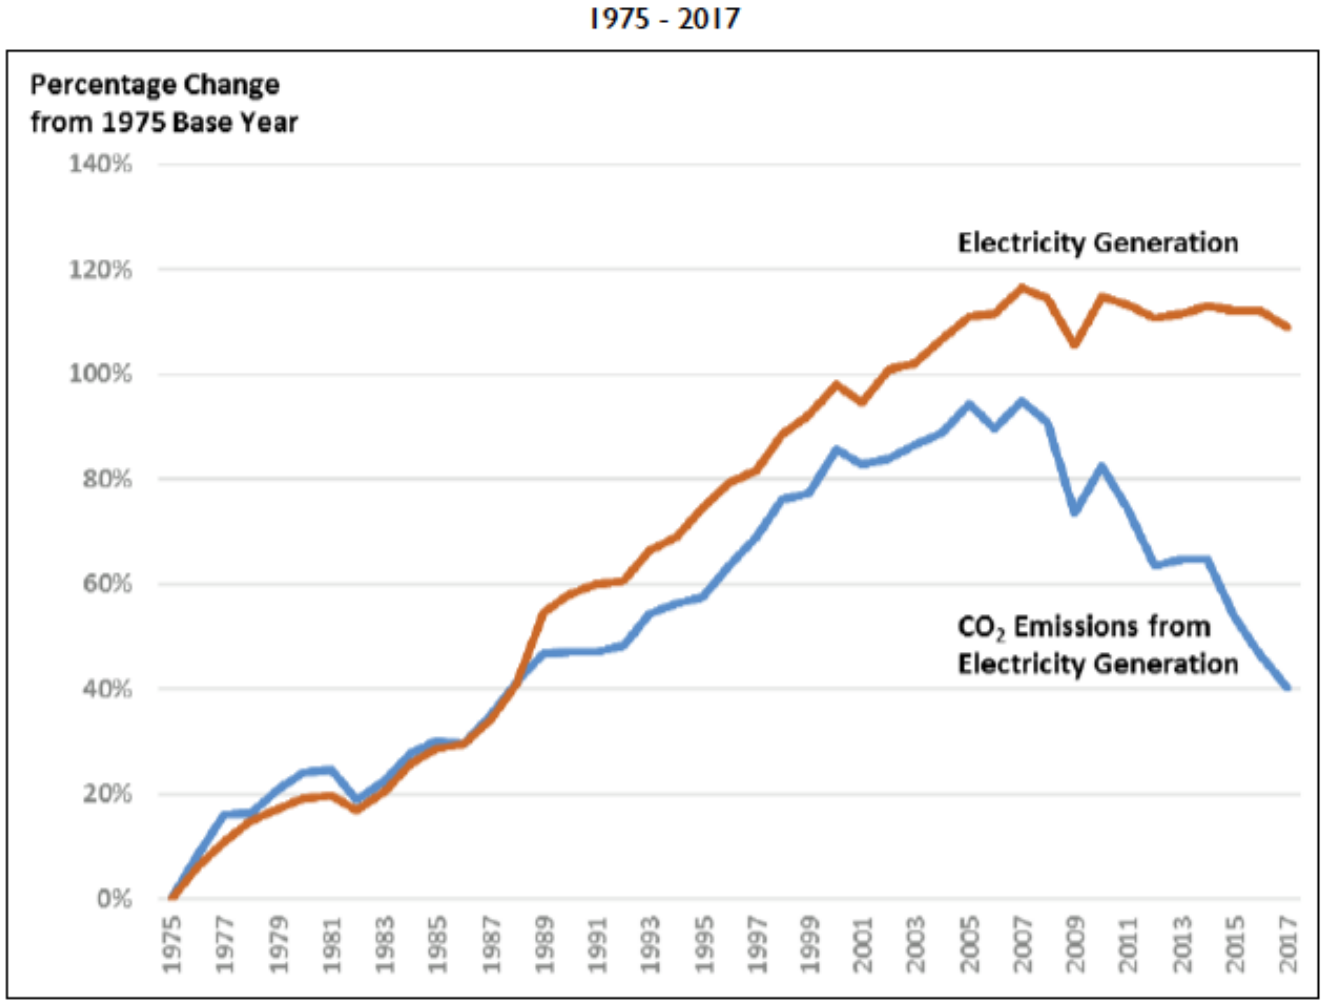
Science Notes and News.

COAL CONSUMPTION AFFECTING CLIMATE.

The furnaces of the world are now burning about 2,000,000,000 tons of coal a year. When this is burned, uniting with oxygen, it adds about 7,000,000,000 tons of carbon dioxide to the atmosphere yearly. This tends to make the air a more effective blanket for the earth and to raise its temperature. The effect may be considerable in a few centuries.

Why Electrification…?



Source: Prepared by CRS; data from EIA, *Monthly Energy Review*, net electricity generation from Table 7.2 and emissions from Table 12.6, http://www.eia.gov/totalenergy/data/monthly/.

Figure from : US Carbon Dioxide Emissions in the Electricity Sector: Factors, Trends and Projections, 2019. Congressional Research Service.

Electricity is rapidly lowering its CO_2 content

Why Electrification…?

Energy Impacts

- Significant site savings using Heat Pumps – typically factors of 3-4 compared to fossil fueled appliances and electric resistance heat and DHW.

- Primary or source energy less clear due to electric distribution system losses. Minimize primary energy by:
    - **On-site generation:** Mainly PV but could include solar hot water
    - **On-site storage:** Limits peak power, allows shifting energy use to time of greatest renewable generation

- (Utilities willing) Electrification allows homes to operate at minimum power using their own generation/storage – big increase in resiliency.

- Not just electrification: energy efficiency will help the transition and keep costs down.

Why Electrification…?

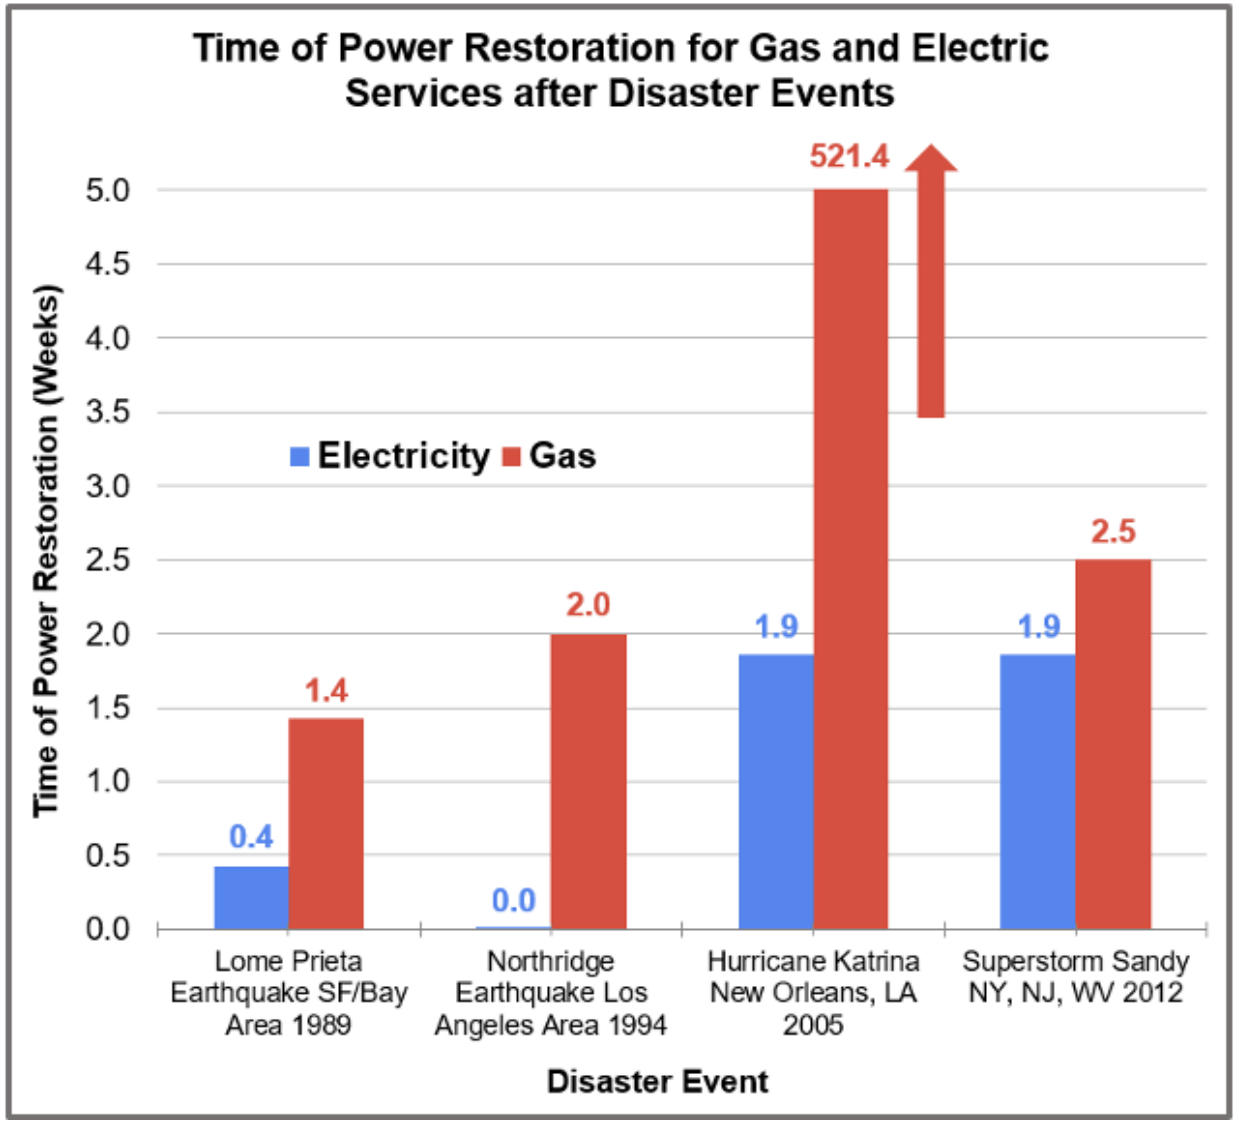
We have to fix all the homes in the country and electrification is easier than other **retrofit** approaches:

- Less home disturbance
- Better cost control
- Easier financing
- Easier work for contractors c/w envelope/window upgrades
- **Easier to sell – give people what they want**

Think about it as the completion of the electrification program begun in the US 100 years ago

Resiliency

- On-site **storage and generation** allows basic home operation during emergencies.
- About half of **natural gas** processing is along the gulf coast and highly vulnerable to *hurricanes and storm* surges.



Transportation

EV-Ready Homes

- Current poor public charging infrastructure:
  - Need to be able to charge at home
- All new homes should have a circuit ready for a charger install
- Trickier in existing home – need a space circuit or new panel/rewiring
- EV is easily be the biggest home load: 7.2 kW up to 50 kW
- Car battery may become the house battery

Healthier Homes

Health Reasons to Eliminate Fossil Fuels

- **Burning fossil fuels:** emit several contaminants of concern:
  - $PM_{2.5}$, NO_2, CO, aldehydes and leaking unburned CH_4
- **In the home:**
  - Field studies show key health-related contaminants related to bring fossil fuels: cooking and poor appliance venting
  - Electrification removes need for combustion safety testing, CO alarms
  - EPRI study: Electrification results in more than 12,000 avoided deaths and a monetized health benefit of $108B per year…. *Just for California plus additional benefits from cleaner outdoor air*
- **Outside air:** PM2.5 & NO_2
  - Environmental Justice Issue – often worse in disadvantaged communities

Safer Homes

Key safety issues are:

- **Carbon monoxide** – No concerns if home is all-electric
- **Fire safety** – No naked flames
- **Kitchen safety** - No naked flames
  (Induction cooking inherently safer – cooler surfaces for induction cooktops, no flames)
- **No gas explosions**
  A key risk factor for utilities – see, for example, PG&E's bad reputation from occasional home explosions
- **Earthquake safety**
  Post-earthquake fires usually a bigger hazard than the earthquake itself

Health and Environmental Justice

Removing poor appliances: e.g. Wall Furnaces

- Wall furnaces are chronically poor at venting
- Causes moisture problems and high levels of combustion contaminants
- Even worse if kitchen of bath exhausts are used

Their low capacity serving small spaces makes them ideal candidates for low-cost replacement with a Heat Pump – possibly even a 120V Heat Pump

This would serve Low-Income households the most

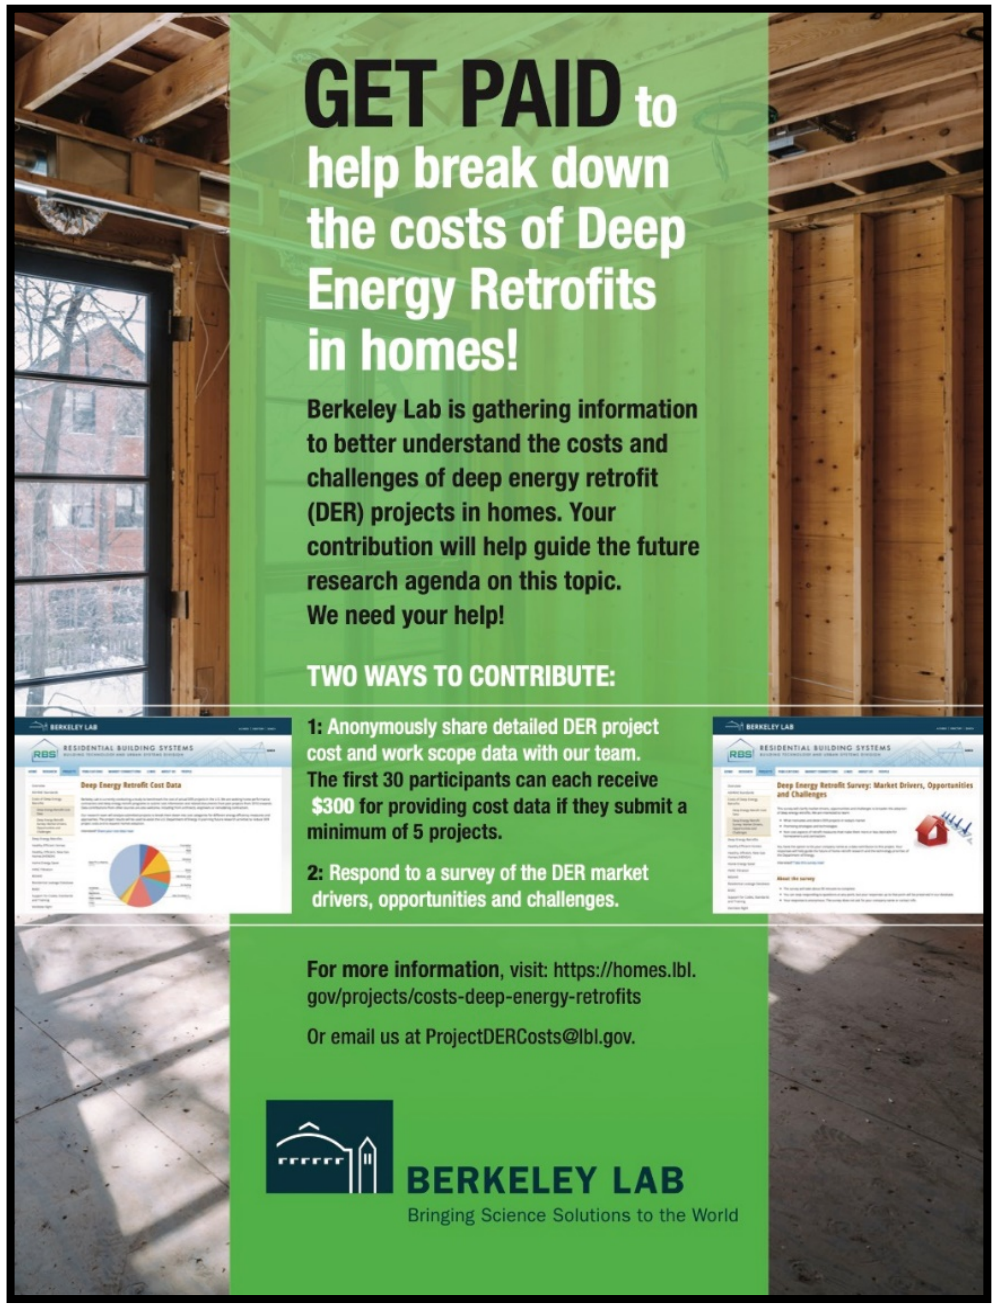
- More likely to have wall furnaces
- Smaller dwellings have higher contaminant concentrations
- Low income dwellings less likely to have ventilation systems

Eliminate use of GAS cooking appliances as supplemental heat

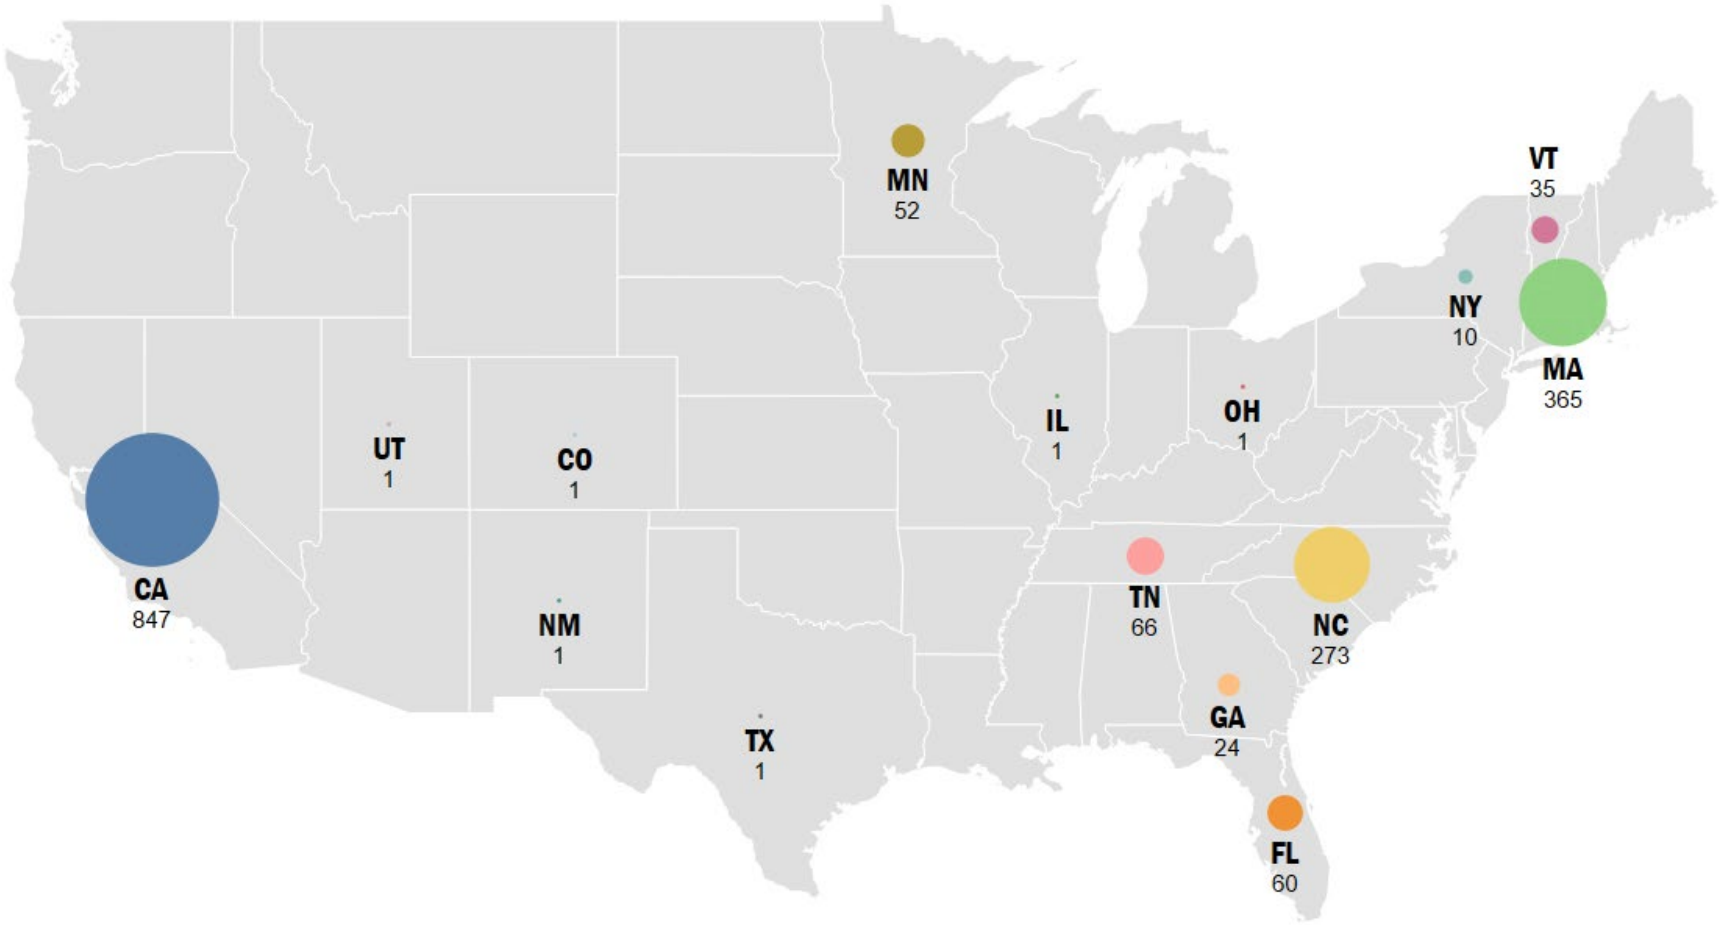
- Need to provide good low operating cost options for low income households

Reducing the Cost of Decarbonization / Electrification

Data Solicitation

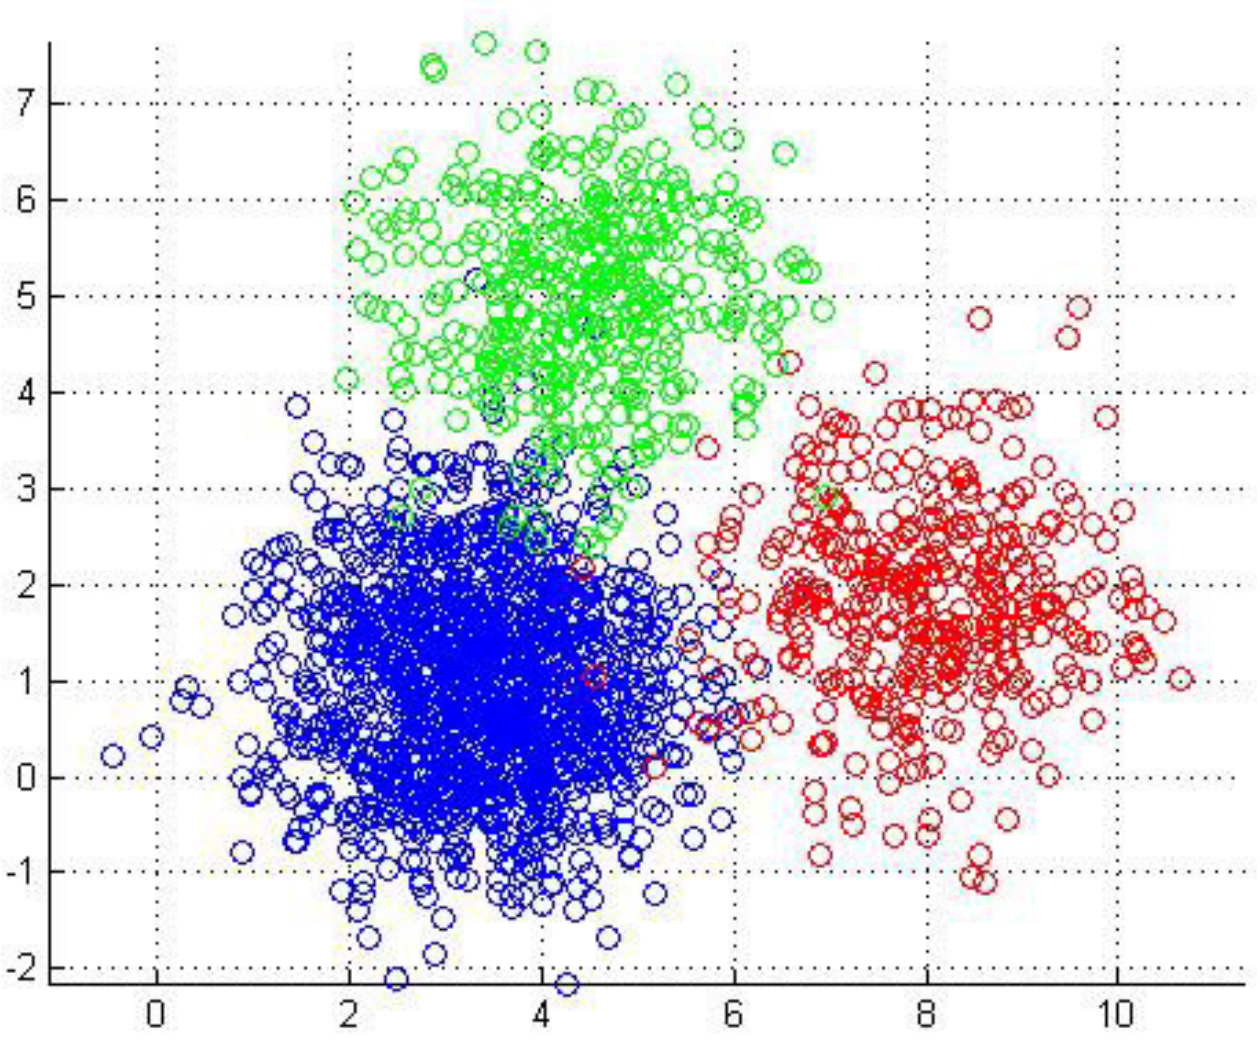


Data Base Summary



12 Programs	1,739 Projects	10,512 Measures	3,294,946 ft^2	$24,689,213

Clustering Project Types



Unsupervised **Machine Learning** approach that groups similar objects such that the objects in the same group are more similar to each other than to objects in the other groups.

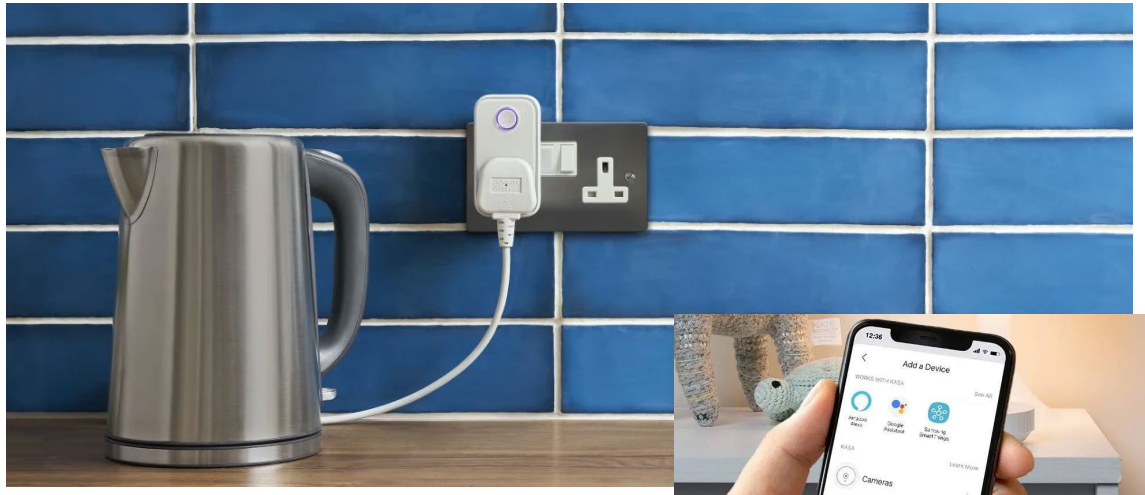
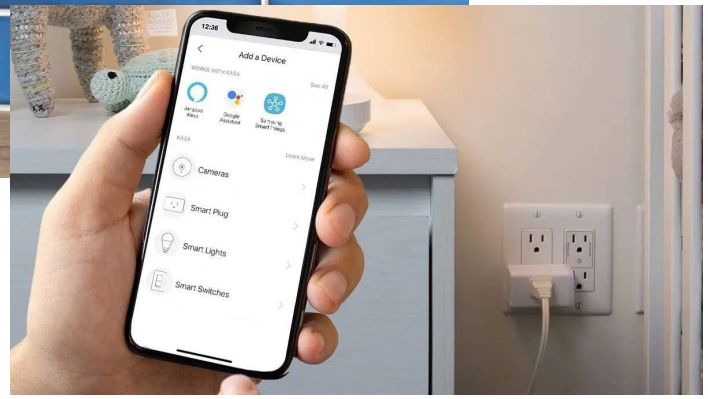
10A, **1200W**	8.3A, **1000W**	6.3-15A, **~1400W**
LG WM3998HBA	GE GeoSpring	Innova HPAC 2.0

Source - Sean Armstrong, Redwood Energy (2020)

Innovative Technology

- Nicer, better-performing equipment
- Switchable outlets or power strips so you can really turn stuff off
  - A lot of things use power even when “off”
- Smart plugs/strips can operate on timers or smart phone apps using Bluetooth/wi-fi





Innovative Technology: Time shifting using storage

Can be charged from onsite solar or low-cost mid-day grid power

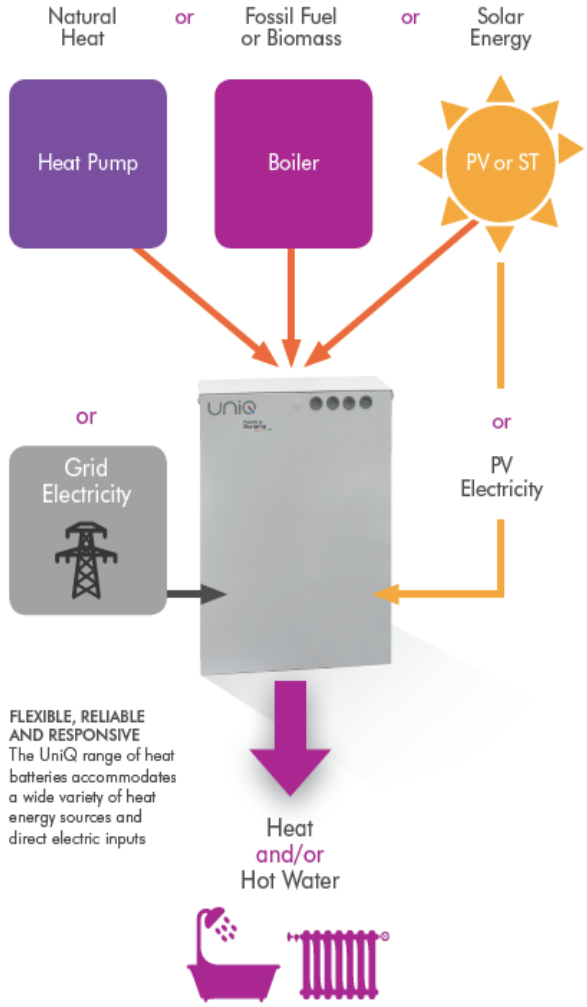
Good for disadvantaged/low income communities: avoid peak pricing and demand charges

Electric Battery

- 3 to 5 KWh in every home – much less than 13.5 kWh ($13k) Tesla Powerwall

Thermal Storage

- Safe, common, cheap phase change materials
- 10.5 KWh in same space as 50 gallon tank



What's Next?

- Cost Compression
  - Technology, Soft Costs, Behavior, New Metrics
  - Streamlining/Reducing code and permitting requirements
- Standardized packages of upgrades to simplify decision-making process
- Electrification for Low-Income households
  - Drop-in/Plug-in/DIY approaches
  - Transportable technologies
- Over-come market fears about heat pump performance, higher energy costs, induction cooking
- Document health and IAQ outcomes of electrification
- How to overcome emergency equipment replacement
- Homeowner electrification ambassador programs
- Contractor networks

Resources

- For electrification big picture: **Rewiring America** and **Rewiring Communities**
- For power-restricted homes: **Redwood Energy Pocket Guide**
- Check with your contractor or utility for rebates

Rewiring Communities:

A Plan to Accelerate Climate Action and Environmental Justice By Investing in Household Electrification at the Local Level
